Comprehension:

Read the given passage and answer the questions that follow.

Antioxidants include Vitamin A, C & E and yellow coloured carotenoids, such as beta carotene. Antioxidants help to prevent harmful effect of free radicals which are formed during normal metabolism and by some external factors such as X rays, UV radiation and pollution. Free radicals are responsible for the development of various diseases including cancer and heart disease. Therefore antioxidants should be considered as a part of preventive medicine. There are a number of naturally occurring substances in food such as vitamins and phenolic compounds which are large molecules consisting of a large number of ring structure which have antioxidant properties. It is also possible to purchase antioxidant vitamin supplement tablets.

Recent research has estimated that the risk of cancer and heart disease is considerably lower in people who consume 5-7 servings of antioxidant rich fruits and vegetables. It has been proposed that the extra health benefits may derive from the above average intake of these compounds. This is supported by extensive medical studies which indicate the diets high in antioxidant rich foods such as fruits and vegetables offer significant proportion against general degenerative diseases.

More research is needed, however, to substantiate this further, and to also consider the importance of non nutrient antioxidants in the diet, as well as other protective plant substances in foods which may not be antioxidants. At present, it appears that the wide mix of antioxidants obtained from plant foods work more effectively in body than single supplements with pure antioxidants in tablet form although these may be off value in some circumstances.

SubQuestion No : 1

Antioxidants include Vitamin A, C & E and yellow coloured carotenoids, such as beta carotene. Antioxidants help to prevent harmful effect of free radicals which are formed during normal metabolism and by some external factors such as X rays, UV radiation and pollution. Free radicals are responsible for the development of various diseases including cancer and heart disease. Therefore antioxidants should be considered as a part of preventive medicine. There are a number of naturally occurring substances in food such as vitamins and phenolic compounds which are large molecules consisting of a large number of ring structure which have antioxidant properties. It is also possible to purchase antioxidant vitamin supplement tablets.

Recent research has estimated that the risk of cancer and heart disease is considerably lower in people who consume 5-7 servings of antioxidant rich fruits and vegetables. It has been proposed that the extra health benefits may derive from the above average intake of these compounds. This is supported by extensive medical studies which indicate the diets high in antioxidant rich foods such as fruits and vegetables offer significant proportion against general degenerative diseases.

More research is needed, however, to substantiate this further, and to also consider the importance of non nutrient antioxidants in the diet, as well as other protective plant substances in foods which may not be antioxidants. At present, it appears that the wide mix of antioxidants obtained from plant foods work more effectively in body than single supplements with pure antioxidants in tablet form although these may be off value in some circumstances.
