Comprehension:

Read the following passage carefully and answer the given questions.

It’s quite relevant to concede here that the anti-larval strategy involving spraying of breeding sites at a weekly interval, that has long been in practice across India, is now being questioned, mainly for two reasons. One being the reduced efficacy of the larvicides used. A World Health Organisation report, published in the Technical Report Series, says that most of the commonly used chemical larvicides are not as effective as they were thought to be earlier. Due to prolonged and indiscriminate use, the larvae of some vector mosquitoes have become resistant to them. Besides many other countries, India too has identified such insecticidal resistance, says the WHO report. Another reason experts cite against the use of chemical larvicides is their risk factor. The WHO has already warned that almost all the chemical poisons used for killing mosquito larvae across the world are harmful. On the other hand, microbial toxins are safe and less polluting.
